Storypoint Prediction - titanium

September 6, 2024

1 Storypoint Prediction: Regression Approach

1.1 Preparation

[ ]:
```
import os
import json

import matplotlib.pyplot as plt
import numpy as np
import pandas as pd
import seaborn as sns
from scipy.sparse import csr_matrix, hstack, vstack

from sklearn.pipeline import Pipeline
from sklearn.preprocessing import RobustScaler
from sklearn.metrics import mean_squared_error, r2_score, mean_absolute_error,␣
 ↪f1_score, precision_score, recall_score, accuracy_score
from sklearn.feature_extraction.text import CountVectorizer
from sklearn.model_selection import cross_val_score, learning_curve,␣
 ↪validation_curve
from trainer import GridSearchCVTrainer

project_name = 'titanium'
```

1.1.1 Plot learning curve

[ ]:
```
def plot_learning_curve(estimator, title, X, y, ylim=None, cv=None,
                        n_jobs=-1, train_sizes=np.linspace(.1, 1.0, 10)):
    plt.figure()        # Create new figure
    plt.title(title)    # Set title of the figure

    # Set y-axis limits: ylim=(min, max)
    if ylim is not None:
        plt.ylim(*ylim)

    plt.xlabel("Training examples")  # Set x-axis label
    plt.ylabel("Score")               # Set y-axis label
```

```
    # Generate learning curve data
    train_sizes, train_scores, test_scores = learning_curve(
        estimator, X, y, cv=cv, n_jobs=n_jobs, train_sizes=train_sizes,␣
↪scoring='neg_mean_squared_error')

    train_scores_mean = np.mean(train_scores, axis=1)  # Calculate mean of␣
↪training scores
    train_scores_std = np.std(train_scores, axis=1)    # Calculate standard␣
↪deviation of training scores
    test_scores_mean = np.mean(test_scores, axis=1)    # Calculate mean of test␣
↪scores
    test_scores_std = np.std(test_scores, axis=1)      # Calculate standard␣
↪deviation of test scores

    plt.grid()  # Display grid

    # Fill the area between the mean training score and the mean +/- std␣
↪training score
    plt.fill_between(train_sizes, train_scores_mean - train_scores_std,
                     train_scores_mean + train_scores_std, alpha=0.1,
                     color="r")

    # Fill the area between the mean test score and the mean +/- std test score
    plt.fill_between(train_sizes, test_scores_mean - test_scores_std,
                    test_scores_mean + test_scores_std, alpha=0.1, color="g")

    # Plot mean training score as points
    plt.plot(train_sizes, train_scores_mean, 'o-', color="r",
             label="Training score")
    # Plot mean test score as points
    plt.plot(train_sizes, test_scores_mean, 'o-', color="g",
             label="Validation score")

    plt.legend(loc="best")  # Display legend
    return plt
```

1.1.2 Plot validation curve

[ ]:
```
def plot_validation_curve(estimator, title, X, y, param_name, param_range,
                          y_lim=None, cv=10, n_jobs=-1):
    train_scores, val_scores = validation_curve(estimator=estimator, X=X, y=y,
                                                param_name=param_name,␣
↪param_range=param_range,
                                                cv=cv, n_jobs=n_jobs,
                                               ␣
↪scoring='neg_mean_squared_error')
```

```
    # Calculate mean and standard deviation of training and validation scores
    train_mean = np.mean(train_scores, axis=1)
    tran_std = np.std(train_scores, axis=1)
    val_mean = np.mean(val_scores, axis=1)
    val_std = np.std(val_scores, axis=1)
    print(val_mean)

    # Plot train scores
    plt.plot(param_range, train_mean, color='r', marker='o', markersize=5,␣
↪label='Training score')
    plt.fill_between(param_range, train_mean + tran_std, train_mean - tran_std,␣
↪alpha=0.15, color='r')

    # Plot validation scores
    plt.plot(param_range, val_mean, color='g', linestyle='--', marker='s',␣
↪markersize=5, label='Validation score')
    plt.fill_between(param_range, val_mean + val_std, val_mean - val_std,␣
↪alpha=0.15, color='g')

    plt.title(title)        # Set title of the plot
    plt.grid()              # Display grid
    plt.xscale('log')       # Set x-axis scale to log
    plt.legend(loc='best')  # Display legend
    plt.xlabel('Parameter') # Set x-axis label
    plt.ylabel('Score')     # Set y-axis label

    # Set y-axis limits
    if y_lim != None:
        plt.ylim(y_lim)

    return plt
```

1.1.3 Evaluate model

[ ]:
```
def evaluate_model(model, model_name, X_test, y_test, y_logscale=False,␣
↪save_directory=None):
    y_pred = model.predict(X_test)
    if(y_logscale):
        y_pred = np.exp(y_pred)

    lines = [model_name + '\'s evaluation results:']

    mse = mean_squared_error(y_test, y_pred)
    rmse = np.sqrt(mse)
    mae = mean_absolute_error(y_test, y_pred)
    r2 = r2_score(y_test, y_pred)
```

```
    lines.append(f' - Mean squared error:      {mse:.2f}')
    lines.append(f' - Root mean squared error: {rmse:.2f}')
    lines.append(f' - Mean absolute error:     {mae:.2f}')
    lines.append(f' - R2 error:                {r2:.2f}')

    y_pred = np.round(y_pred).astype(int)
    f1 = f1_score(y_test, y_pred, average='weighted')
    precision = precision_score(y_test, y_pred, average='weighted',␣
 ↪zero_division=0)
    recall = recall_score(y_test, y_pred, average='weighted', zero_division=0)
    accuracy = accuracy_score(y_test, y_pred)

    lines.append(f' - F1 score:                {f1:.2f}')
    lines.append(f' - Precision:               {precision:.2f}')
    lines.append(f' - Recall:                  {recall:.2f}')
    lines.append(f' - Accuracy:                {accuracy:.2f}')
    lines.append('---------------------------------------------------')
    lines.append('')

    # Save to file

    if(save_directory != None):
        filename = save_directory + project_name + '.txt'
        directory = os.path.dirname(filename)
        if not os.path.exists(directory):
            os.makedirs(directory)
        with open(filename, 'a') as f:
            for line in lines:
                print(line)
                f.write(line + '\n')
    else:
        for line in lines:
            print(line)
```

1.1.4 Set random seed

[ ]:
```
import numpy as np
import random
import os

# Set random seed for numpy
np.random.seed(42)

# Set random seed for random
random.seed(42)

# Set random seed for os
```

```
os.environ['PYTHONHASHSEED'] = '42'
```

1.2 Dataset set-up

1.2.1 Bag of Words preprocessing

This is a Bag of Words preprocess approach. I will use 2 CountVectorizer from sklearn to change title and description to two 2 vectors and then concatenate them together. In the rest of this notebook, I will use cross-validation instead hold-out. Therefore, I will join the validation set with training set.

NOTE: I don't add the length of description (and the title) because it has a big deviation which may cause noise.

[ ]:
```
# Import and remove NaN value

data_train = pd.concat([pd.read_csv('data/' + project_name + '/' + project_name␣
 ↪+ '_train.csv'),
                        pd.read_csv('data/' + project_name + '/' + project_name␣
 ↪+ '_valid.csv')])
data_test = pd.read_csv('data/' + project_name + '/' + project_name + '_test.
 ↪csv')

data_train['description'].replace(np.nan, '', inplace=True)
data_test['description'].replace(np.nan, '', inplace=True)

# Vectorize title
title_vectorizer = CountVectorizer(ngram_range=(1, 2), min_df=2)
title_vectorizer.fit(pd.concat([data_train['title'], data_test['title']]))

# Vectorize description
description_vectorizer = CountVectorizer(ngram_range=(1, 2), min_df=2)
description_vectorizer.fit(pd.concat([data_train['description'],␣
 ↪data_test['description']]))

X_train = hstack([title_vectorizer.transform(data_train['title']).astype(float),
                  description_vectorizer.transform(data_train['description']).
 ↪astype(float),
                  data_train['title'].apply(lambda x : len(x)).to_numpy().
 ↪reshape(-1, 1),
                  data_train['description'].apply(lambda x : len(x)).to_numpy().
 ↪reshape(-1, 1)
                 ])

y_train = data_train['storypoint'].to_numpy().astype(float)
```

```
X_test = hstack([title_vectorizer.transform(data_test['title']).astype(float),
                 description_vectorizer.transform(data_test['description']).
 ↪astype(float),
                 data_test['title'].apply(lambda x : len(x)).to_numpy().
 ↪reshape(-1, 1),
                 data_test['description'].apply(lambda x : len(x)).to_numpy().
 ↪reshape(-1, 1)
                ])

y_test = data_test['storypoint'].to_numpy().astype(float)
```

[ ]:
```
print('Check training dataset\'shape:', X_train.shape, y_train.shape)
print('Check testing dataset\'shape:', X_test.shape, y_test.shape)
```

```
Check training dataset'shape: (2026, 20875) (2026,)
Check testing dataset'shape: (225, 20875) (225,)
```

I will use log-scale the label to get a normal distribution of it.

[ ]:
```
y_train_log = np.log(y_train)
```

1.3 Model training

1.3.1 Linear Regressor

[ ]:
```
from sklearn.linear_model import ElasticNet
```

Define params-grid:

[ ]:
```
dict_param = {
    'alpha': [.0001, .001, .01, .1, 1, 10, 100, 1000, 10000],
    'l1_ratio': [.0, .2, .4, .6, .8, 1],
    'max_iter': [3000],
    'random_state': [42]
}
```

[ ]:
```
gridsearch = GridSearchCVTrainer(name='Elastic Net', model=ElasticNet(),␣
 ↪param_grid=dict_param, cv=5, n_jobs=5)
gridsearch.load_if_exists()
gridsearch.fit(X_train, y_train_log)

elastic_model = gridsearch.best_estimator_
elastic_model.fit(X_train, y_train_log)
```

```
There is no checkpoint file for this model.

100%|      | 54/54 [26:37<00:00, 29.59s/it]
```

[ ]:
```
ElasticNet(alpha=0.01, l1_ratio=1, max_iter=3000, random_state=42)
```

[ ]:
```
evaluate_model(elastic_model, 'Elastic Net model', X_test, y_test,␣
↪y_logscale=True, save_directory='results/BoW/')
```

```
Elastic Net model's evaluation results:
 - Mean squared error:      12.63
 - Root mean squared error: 3.55
 - Mean absolute error:     2.17
 - R2 error:                -0.02
 - F1 score:                0.20
 - Precision:               0.27
 - Recall:                  0.19
 - Accuracy:                0.19
--------------------------------------------------
```

[ ]:
```
elastic_model.get_params()
```

[ ]:
```
{'alpha': 0.01,
 'copy_X': True,
 'fit_intercept': True,
 'l1_ratio': 1,
 'max_iter': 3000,

 'warm_start': False}
```

1.3.2 Support Vector Regressor

[ ]:
```
from sklearn.svm import SVR
```

[ ]:
```
dict_param = {
    'C': [.0001, .001, .01, .1, 1, 10, 100, 1000, 10000],
    'gamma': np.logspace(-9, 3, 13),
    'kernel': ['rbf']
}
```

[ ]:
```
grid_search = GridSearchCVTrainer(name="Support Vector Regressor",model=SVR(),␣
↪param_grid=dict_param, cv=5, n_jobs=5)
grid_search.load_if_exists()
grid_search.fit(X_train, y_train_log)

svr_model = grid_search.best_estimator_
svr_model.fit(X_train, y_train_log)
```

```
There is no checkpoint file for this model.
```

```
100%|      | 117/117 [03:04<00:00,  1.58s/it]
```

[ ]:
```
SVR(C=1000, gamma=1e-08)
```

[ ]:
```
evaluate_model(svr_model, 'SVR model', X_test, y_test, y_logscale=True,␣
↪save_directory='results/BoW/')
```

```
SVR model's evaluation results:
 - Mean squared error:      12.58
 - Root mean squared error: 3.55
 - Mean absolute error:     2.19
 - R2 error:                -0.01
 - F1 score:                0.21
 - Precision:               0.16
 - Recall:                  0.30
 - Accuracy:                0.30
--------------------------------------------------
```

[ ]:
```
svr_model.get_params()
```

[ ]:
```
{'C': 1000,
 'cache_size': 200,
 'coef0': 0.0,

```

1.3.3 Random Forest Regressor

[ ]:
```
from sklearn.ensemble import RandomForestRegressor
```

[ ]:
```
dict_param = {
    'max_depth' : [1000, 2000, 5000],
    'min_samples_split': [25, 200, 1000],
    'min_samples_leaf': [1, 2, 3, 4],
    'max_features': [50, 100, 200],
    'n_estimators': [1024],
    'random_state': [42]
}
```

[ ]:
```
grid_search = GridSearchCVTrainer(name="Random Forest Regressor",
                                  model=RandomForestRegressor(),
```

```
                                    param_grid=dict_param, cv = 5, n_jobs=5)
grid_search.load_if_exists()
grid_search.fit(X_train, y_train_log)

rfr_model = grid_search.best_estimator_
rfr_model.fit(X_train, y_train_log)
```

```
There is no checkpoint file for this model.

100%|      | 108/108 [15:49<00:00,  8.80s/it]
```

[ ]:
```
RandomForestRegressor(max_depth=1000, max_features=200, min_samples_split=25,
                      n_estimators=1024, random_state=42)
```

[ ]:
```
evaluate_model(rfr_model, 'Random Forest model', X_test, y_test,␣
↪y_logscale=True, save_directory='results/BoW/')
```

```
Random Forest model's evaluation results:
 - Mean squared error:      12.15
 - Root mean squared error: 3.49
 - Mean absolute error:     2.00
 - R2 error:                0.02
 - F1 score:                0.23
 - Precision:               0.27
 - Recall:                  0.25
