1 Storypoint Prediction: Regression Approach

1.1 Preparation

```
[]: import os
     import json
     import matplotlib.pyplot as plt
     import numpy as np
     import pandas as pd
     import seaborn as sns
     from scipy.sparse import csr_matrix, hstack, vstack
     from sklearn.pipeline import Pipeline
     from sklearn.preprocessing import RobustScaler
     from sklearn.metrics import mean_squared_error, r2_score, mean_absolute_error, u

¬f1_score, precision_score, recall_score, accuracy_score
     from sklearn.feature_extraction.text import CountVectorizer
     from sklearn.model_selection import cross_val_score, learning_curve, u
      ⇒validation curve
     from trainer import GridSearchCVTrainer
     project_name = 'duracloud'
```

1.1.1 Plot learning curve

```
# Generate learning curve data
  train_sizes, train_scores, test_scores = learning_curve(
       estimator, X, y, cv=cv, n_jobs=n_jobs, train_sizes=train_sizes,__
⇔scoring='neg_mean_squared_error')
  train scores mean = np.mean(train scores, axis=1) # Calculate mean of |
⇔training scores
  train_scores_std = np.std(train_scores, axis=1) # Calculate standard_
→ deviation of training scores
  test scores mean = np.mean(test scores, axis=1) # Calculate mean of test
\hookrightarrowscores
  test_scores_std = np.std(test_scores, axis=1) # Calculate standard_
→deviation of test scores
  plt.grid() # Display grid
  # Fill the area between the mean training score and the mean +/- stdu
⇔training score
  plt.fill_between(train_sizes, train_scores_mean - train_scores_std,
                    train_scores_mean + train_scores_std, alpha=0.1,
                    color="r")
  # Fill the area between the mean test score and the mean +/- std test score
  plt.fill_between(train_sizes, test_scores_mean - test_scores_std,
                   test_scores_mean + test_scores_std, alpha=0.1, color="g")
  # Plot mean training score as points
  plt.plot(train sizes, train scores mean, 'o-', color="r",
           label="Training score")
  # Plot mean test score as points
  plt.plot(train_sizes, test_scores_mean, 'o-', color="g",
           label="Validation score")
  plt.legend(loc="best") # Display legend
  return plt
```

1.1.2 Plot validation curve

```
# Calculate mean and standard deviation of training and validation scores
  train_mean = np.mean(train_scores, axis=1)
  tran_std = np.std(train_scores, axis=1)
  val_mean = np.mean(val_scores, axis=1)
  val_std = np.std(val_scores, axis=1)
  print(val_mean)
  # Plot train scores
  plt.plot(param_range, train_mean, color='r', marker='o', markersize=5,u
⇔label='Training score')
  plt.fill_between(param_range, train_mean + tran_std, train_mean - tran_std,__
⇔alpha=0.15, color='r')
  # Plot validation scores
  plt.plot(param_range, val_mean, color='g', linestyle='--', marker='s',u
→markersize=5, label='Validation score')
  plt.fill_between(param_range, val_mean + val_std, val_mean - val_std,__
⇒alpha=0.15, color='g')
  plt.title(title) # Set title of the plot
  plt.grid()
                         # Display grid
  plt.xscale('log')
                        # Set x-axis scale to log
  plt.legend(loc='best') # Display legend
  plt.xlabel('Parameter') # Set x-axis label
  plt.ylabel('Score')
                         # Set y-axis label
  # Set y-axis limits
  if y_lim != None:
      plt.ylim(y_lim)
  return plt
```

1.1.3 Evaluate model

```
lines.append(f' - Mean squared error:
                                             {mse:.2f}')
  lines.append(f' - Root mean squared error: {rmse:.2f}')
  lines.append(f' - Mean absolute error:
                                             {mae:.2f}')
                                             {r2:.2f}')
  lines.append(f' - R2 error:
  y_pred = np.round(y_pred).astype(int)
  f1 = f1_score(y_test, y_pred, average='weighted')
  precision = precision_score(y_test, y_pred, average='weighted',__
⇒zero division=0)
  recall = recall_score(y_test, y_pred, average='weighted', zero_division=0)
  accuracy = accuracy_score(y_test, y_pred)
                                             {f1:.2f}')
  lines.append(f' - F1 score:
  lines.append(f' - Precision:
                                             {precision:.2f}')
  lines.append(f' - Recall:
                                             {recall:.2f}')
  lines.append(f' - Accuracy:
                                             {accuracy:.2f}')
  lines.append('-----
  lines.append('')
  # Save to file
  if(save_directory != None):
      filename = save_directory + project_name + '.txt'
      directory = os.path.dirname(filename)
      if not os.path.exists(directory):
          os.makedirs(directory)
      with open(filename, 'a') as f:
          for line in lines:
              print(line)
              f.write(line + '\n')
  else:
      for line in lines:
          print(line)
```

1.2 Dataset set-up

1.2.1 Bag of Words preprocessing

This is a Bag of Words preprocess approach. I will use 2 CountVectorizer from sklearn to change title and description to two 2 vectors and then concatenate them together. In the rest of this notebook, I will use cross-validation instead hold-out. Therefore, I will join the validation set with training set.

NOTE: I don't add the length of description (and the title) because it has a big deviation which may cause noise.

```
[]: # Import and remove NaN value
```

```
data_train = pd.concat([pd.read_csv('data/' + project_name + '/' + project_name_
 pd.read_csv('data/' + project_name + '/' + project_name_
 ↔+ ' valid.csv')])
data_test = pd.read_csv('data/' + project_name + '/' + project_name + '_test.
 ⇔csv')
data_train['description'].replace(np.nan, '', inplace=True)
data_test['description'].replace(np.nan, '', inplace=True)
# Vectorize title
title_vectorizer = CountVectorizer(ngram_range=(1, 2), min_df=2)
title_vectorizer.fit(pd.concat([data_train['title'], data_test['title']]))
# Vectorize description
description_vectorizer = CountVectorizer(ngram_range=(1, 2), min_df=2)
description_vectorizer.fit(pd.concat([data_train['description'],_

¬data_test['description']]))
X_train = hstack([title_vectorizer.transform(data_train['title']).astype(float),
                  description_vectorizer.transform(data_train['description']).
 ⇔astype(float),
                  data_train['title'].apply(lambda x : len(x)).to_numpy().
 \rightarrowreshape(-1, 1),
                  data_train['description'].apply(lambda x : len(x)).to_numpy().
 \rightarrowreshape(-1, 1)
                ])
y_train = data_train['storypoint'].to_numpy().astype(float)
X_test = hstack([title_vectorizer.transform(data_test['title']).astype(float),
                  description_vectorizer.transform(data_test['description']).
 ⇒astype(float),
                  data_test['title'].apply(lambda x : len(x)).to_numpy().
 \rightarrowreshape(-1, 1),
                  data_test['description'].apply(lambda x : len(x)).to_numpy().
 \hookrightarrowreshape(-1, 1)
                ])
y_test = data_test['storypoint'].to_numpy().astype(float)
```

```
[]: print('Check training dataset\'shape:', X_train.shape, y_train.shape) print('Check testing dataset\'shape:', X_test.shape, y_test.shape)
```

Check training dataset'shape: (552, 3705) (552,)

```
Check testing dataset'shape: (61, 3705) (61,)
```

I will use log-scale the label to get a normal distribution of it.

```
[]: y_train_log = np.log(y_train)
```

1.3 Model training

1.3.1 Linear Regressor

```
[ ]: from sklearn.linear_model import ElasticNet
```

Define params-grid:

```
[]: dict_param = {
    'alpha': [.0001, .001, .01, .1, 1, 10, 100, 1000, 10000],
    'l1_ratio': [.0, .2, .4, .6, .8, 1],
    'max_iter': [10**5]
}
```

```
gridsearch = GridSearchCVTrainer(name='Elastic Net', model=ElasticNet(), param_grid=dict_param, cv=5, n_jobs=5)
gridsearch.load_if_exists()
gridsearch.fit(X_train, y_train_log)

elastic_model = gridsearch.best_estimator_
elastic_model.fit(X_train, y_train_log)
```

Training combination 54/54
